CASE STUDY

FORTH VALLEY ROYAL HOSPITAL, SCOTLAND

One of Britain's major new hospitals, Forth Valley Royal Hospital is the largest NHS construction project ever built in Scotland and one of the most modern and well equipped hospitals in Europe.

Franke Sissons supplied the new hospital with their modern no-touch taps, sensors and spouts to nursing stations and washbasins across the wards and medical units. The company also supplied stainless steel sink units, slop hoppers, scrub up troughs, janitorial units and special endoscopy sinks and cupboards.

The stainless steel and water control products were installed by specialist wall panel manufacture C&B systems as part of their medi-serve range of products and designs.

SPECIFYING SANITARYWARE

Specifying the correct sanitaryware assemblies for hospitals is a complex, detailed and important decision making process. We are well experienced in this area and our products have been installed in many hospitals across the UK. Our range of stainless steel products for hospitals have been specifically designed to meet the important requirements in the HTM 63 and HTM 64 guidelines (Health Technical Memorandum, Sanitary Assemblies) which remain in force in Scotland, Wales and Northern Ireland and the new Health Building Note (HBN) 00-10, Part C standards which have superseded HTM 64 in England.

The new (HBN) 00-10, Part C standards includes additional information about sustainability and infection control, specifying that all new build healthcare facilities should achieve an 'excellent' rating and all refurbishments achieve a 'very good' rating under BREEAM.

Our product range for healthcare includes sanitary fittings such as scrub troughs, disposal units, clinical sinks, utility sinks, plaster sinks, cleaning or janitorial equipment. We also offer a bespoke service for projects with specific requirements.

For further details about our full product range, please refer to our latest version of the Sales Catalogue.

DID YOU KNOW?

HBN 00-10, Part C outlines the policy and performance requirements for sanitary assemblies used in healthcare facilities. These requirements are a set of essential standards of quality and safety that sanitary facilities must comply with. It supersedes Health Technical Memorandum 64.

The Department of Health

Our RIBA approved CPD on using stainless steel in the commercial washroom will help you understand the benefits of specifying stainless steel products.

STAINLESS STEEL MEANS HYGIENE

WHY USE STAINLESS STEEL?

Stainless steel has a proven record of success in areas such as hospitals where sanitation and ease of cleaning are so important. Stainless steels hygienic properties, corrosion resistance, strength and formability are important benefits to users in this sector. Its characteristics of having no pores or cracks to harbour dirt, grime or bacteria is another reason why stainless steel meets all the criteria of a healthcare facility.

The material is robust, easy to maintain and therefore very durable which makes the products economical over the lifetime of the building. Other benefits include:

- Resistance to moisture
- Scratches and grooves lose their sharp edges quickly and blend into the surface
- Lasts for a lifetime of the building
- Stainless steel is fully recyclable and made from up to 80% recycled materials

CASE STUDY

MURRAY ROYAL HOSPITAL SCOTLAND

The £75 million Murray Royal Hospital, Perth in Scotland, provides state of the art mental healthcare for adults across Tayside. It is also the first healthcare non-profit distributing project in Scotland and is part of a wider £845m programme so it was important that top quality specification supported by all the up to date water saving and quality agencies like WRAS, BMA and the latest CE compliance boxes were ticked.

“We’ve played a small part” Franke Washroom System’s Managing Director Andy Dukelow explains, “In ensuring the hospital can deliver well into the future.” Working with a leading UK FF&E specialist, the company has supplied all manner of janitorial and healthcare washroom products to the project. “Longevity of product performance and the solid reassurance of technical back up and service is critical to a development like Murray Royal,” Dukelow explains.

The specification was exacting to ensure a long, efficient product life and savings in water and energy use. Products from Franke Washroom Systems have included; an array of differing formats of HTM63 stainless steel sinks and worktops, disposal and janitorial units.

SINKS WITH DRAINERS

Our clinical sinks fall in line with the Department for Health recommendation of the sinks that can be used in hospital applications with the following types available:

- ST A – Single bowl, single drainer
- ST B – Single bowl, double drainer
- ST C – Double bowl, single drainer

Manufactured from 1.2 mm thick, grade 304 stainless steel with a satin polish finish, the sink tops are turned down on all four edges and incorporate a wet area recess. To prevent the harbour of dirt, germs and bacteria, all models are without overflow. The bowls are prepared for a 38mm waste outlet and we can supply a flush grated waste as an extra. Stainless steel wall brackets or front leg supports can also be supplied where additional support is required.

Sinks are available with tapholes at 200mm centres, or without tapholes.

RECOMMENDATION

It is recommended by the Department of Health within their (HBN) 00-10, Part C guidelines that sinks used in clinical areas such as dirty utility areas should not have tapholes or overflows, therefore wall mounted taps should be used.

Our RIBA approved CPD on using stainless steel in the commercial washroom will help you understand the benefits of specifying this material.

CLINICAL SINKS

SINKS

Commonly known in the industry as SK 1 (single bowl) and SK 2 (double bowl) sinks, our expertly manufactured models have been designed in accordance with the HTM 64 specification. Manufactured from 1.2 thick, grade 304 stainless steel and with a satin polish finish, the bowls have been prepared for a 38mm waste outlet and come without an overflow. The sink top is turned down on all four edges and incorporates a wet recess area to ensure that any splashes remain inside the bowl.

Sinks are available without tapholes or with tapholes at 200mm centres.

PLASTER SINK

Plaster sinks are used in areas where casting materials are prepared. Designed in accordance with the HTM 64 standard, our PS H plaster sink is manufactured from 1.2mm thick, grade 304 stainless steel with 1.5mm thick for the bowl. The single bowl incorporates a lift out plaster catcher basket which is prepared for a 38mm waste and is supplied with a lid to prevent loose plaster from entering the waste and causing a blockage. It also comes without tapholes or overflow.

A choice of either stainless steel cantilever brackets or front leg supports are supplied separately, one of which will be required to support it.

HTM63 SINKS

We have a full range of HTM 63 sit on sinks with a radiused front edge together with a radiused internal corner at the base of the upstand. Sink bowls are prepared for a 38mm waste outlet and the units are available in 1000mm, 1200mm, 1500mm and 1800mm lengths. All are available either with or without tapholes at 200mm centres.

DID YOU KNOW?

We also make products in grade 316 stainless steel if required. Please ask for more details.

OTHER SINKS

As the leading stainless steel manufacturer in the UK, we have a huge array of other sinks and wash-hand basins which are ideal for general areas and domestic services. These include inset sinks and bowls and wall mounted washbasins.

CLEANING AND JANITORIAL

Franke provide a comprehensive range of cleaning and janitorial products, which will help with the daily cleaning activities within hospitals and healthcare facilities. One of our most popular products is our janitorial unit which is ideal for where space restricts the installation of a separate sink and wash-hand basin.

Our janitorial unit designed to HTM 64 specification with copper tails and a lever operated monobloc mixer tap is made with 1.2mm thick, grade 304 stainless steel and 0.9mm thick for the lower bowl. Supplied with both a 32mm flush grated waste for the top wash bowl and 38mm domed waste outlet for the lower bowl it can be floor standing with all 4 legs or made partly wall hung by just using the front 2 legs and the joggle strip provided.

The unit has a large bottom drainage to allow for a large volume of water and we can even supply a complementing stainless steel bucket if required.

In addition to this, we also have a range of other cleaners sinks and buckets sinks. Please see our full sales catalogue or website for more details.

ADDITIONAL PRODUCTS

BESPOKE PRODUCTS

Where sometimes 'non standard' products are required, we can offer a full design service too. Often this is for areas where cupboards are required with a stainless steel worktop, with or without inset sink or drainer, and made specifically to measure a particular size room.

Worktops can be made to adhere to the HTM 63 specification for laboratory furniture, where the specification requires units to have a bull nose edge.

Our design team have assisted with many projects across this sector and have provided fully customised solutions to match multiple healthcare specifications.
